

## Technical Reference Sheet for PondCare® Ammo-Rocks®

### **Purpose And Benefits:**

PondCare Ammo-Rocks are an all-natural ammonia-removing mineral for use in ornamental fish ponds and water gardens. Ammo-Rocks remove poisonous ammonia produced from fish waste, uneaten fish food, and decomposing algae.

Ammo-Rocks are made from zeolite, a natural ion-exchange resin. Ammo-Rocks exchange harmless sodium ions for toxic ammonia in the water. As the ammonia is attracted to the Ammo-Rocks surface, beneficial nitrifying bacteria grow on the rocks, forming the biological filter. This makes Ammo-Rocks the perfect biological filter media.

### **Directions For Use:**

Ammo-Rocks can be used as a biological filter media with any type of pond filter. Use at least one 10 lb bag for every 300 U.S. gallons (1,135 L) of pond water for best results. Ammo-Rocks is a biological filter media and will not filter out fine particles and is not intended to replace particulate filtration materials, such as foam and brushes. Place Ammo-Rocks in your filter in the same location as your current biological filtration media. Leave as much of your current media as space allows. For best results Ammo-Rocks should be replaced annually at the start of the pond season.

### **Compatibility:**

Ammo-Rocks can be used with all pond fish including goldfish and koi. Ammo-Rocks will not change pH.

### **Sizes Available:**

149B-10 lbs/4.5Kg treats up to 300 gallons (1135 L)
